The non-combustible imitation cigarette consists of a tube (12) with an air inlet (14) at one end and an air outlet at the other end. A cylindrical segment of material (18) which is permeable to air is fitted inside the tube. This material (18) is impregnated with a volatile substance with a free nicotine base.

A second cylindrical segment (20) is fitted alongside the first segment (18). This second segment is also permeable to air and is impregnated with a volatile acid. This acid reacts with the nicotine base material to form a salt with a pH value in the region of 5 to 7.

USE - The user is supplied with nicotine without the danger of fire.
